Over the past few years the Mangroves on the North End of Honeymoon Island have been Systematically Dying.

I suspect an Herbicide is being "Strategically" Applied to kill the Mangroves.

As a *result of* the killing of the Mangroves ~~and of other coastal vegetation~~, the Beach has slowly, drastically and systematically Eroded, ~~Due to the Loss of the Root Structure.~~

I've lived *nearby* Honeymoon Island all my life.

And, I am Fully Aware that the Sand on the beach "Naturally" Shifts along the Coastline.

But, ~~this is Not the Case.~~

The recent beach Erosion that is occurring on North Honeymoon is Manmade.

The Beach Erosion on the North End of Honeymoon Island is a Direct Result of the systematic killing of Vegetation along the Shoreline in an Deliberate act of Eco-Terrorism in order to Manipulate Coastal Erosion.

Thereby, formulate the appearance of "*so-called*" Climate Change!

In addition, I've *also* noticed the MultiFarious use of Helicopters Spraying Insecticides over the *MicroHabitat* of Both Honeymoon and Caladesi Island, applying Aerial Insecticides, Killing all insects and Destroying the EcoSensitive habitat of what is remaining of our Endangered Coastal Ecology.

The Deliberate *Killing* and Catastrophic *Devastation* of Both Plant and Animal Life, aswell as the "routine" seasonal Burning of such Micro sensitive Habitats has also caused the Osprey to seek Nesting in Areas, other than their Natural Habitat.

Habitat Protection and Preservation of the Coastal Ecology has been Egregiously and Systematically Violated by those entrusted to protect such Environment.

Here are some photographs as proof of my findings.

Consider this issue to be on notice.
